Beispielformelsammlung

Formelsammlung

- Dichtefunktion der Normalverteilung mit Erwartungswert μ und Varianz σ^2

$$f(x) = \frac{1}{\sqrt{2\pi\sigma^2}} \exp\left(\frac{-(x-\mu)^2}{2\sigma^2}\right)$$

- Dichtefunktion der Standardnormalverteilung

$$\phi(x) = \frac{1}{\sqrt{2\pi}} \exp\left(-\frac{1}{2}x^2\right)$$

- Verteilungsfunktion der Standardnormalverteilung

$$\Phi(x) \equiv \int_{-\infty}^{x} \frac{1}{\sqrt{2\pi}} e^{-\frac{1}{2}w^2} dw$$

- Standard-logistische Verteilung

$$\Lambda(x) \equiv \frac{\exp(x)}{1+\exp(x)} = \frac{1}{1+\exp(-x)}$$

- $W \sim N(\mu, \sigma^2)$. Dann gilt

$$E[W|W > b] = \mu + \sigma\lambda(a), \quad a = \frac{b-\mu}{\sigma}, \quad \lambda(a) = \frac{\phi(a)}{1-\Phi(a)}$$

- Im Random-Effects-Modell gilt:

$$\lambda = 1 - \sqrt{\frac{\sigma_u^2}{\sigma_u^2 + T\sigma_a^2}}$$

- Likelihood-Ratio-Teststatistik:

$$LR = 2(L_{ur} - L_r),$$

hierbei steht L für den Wert der Log-Likelihood.

Hinweis: Dem kritischen Wert bei F- oder χ^2-basierten Hypothesentests zum Signifikanzniveau α entspricht das $(1-\alpha)$-Quantil der entsprechenden Verteilung, beim zweiseitigen t-Test das $(1-\frac{\alpha}{2})$-Quantil (df = Freiheitsgrade).
